Digital Evidence and Computer Crime
Forensic Science, Computers and the Internet
Third Edition

by
Eoghan Casey
cmdLabs, Baltimore, Maryland, USA

With contributions from
Susan W. Brenner
Bert-Jaap Koops
Tessa Robinson
Bradley Schatz
Brent E. Turvey
Terrance Maguire
Monique Ferraro
Michael McGrath
Christopher Daywalt
Benjamin Turnbull
Acknowledgments

I would like to dedicate this work to my wife Rachel, and daughter Tigerlily.

Benjamin Turnbull

In the six years since the second edition of this text, I have worked with many brilliant digital investigators and I have taught hundreds of students. Together we tackled sophisticated network intrusions and complex forensic investigations that stretched us mentally and physically, taking over our lives for a time. I am deeply grateful to each of you for your friendship and influence, and I would like to give special thanks to the following.

The contributors Susan Brenner, Christopher Daywalt, Monique Mattei Ferraro, Bert-Jaap Koops, Terrance Maguire, Mike McGrath, Tessa Robinson, Bradley Schatz, Ben Turnbull, and Brent Turvey, for your inspiration and persistence.

My entire family, for your support and patience. Genevieve, Roisin, and Hesper are my lifeblood, reminding me what is important in life and lifting me with limitless love every day. Ita O’Connor made all this possible, loving me unconditionally, teaching me right from wrong and how to write, and providing regular encouragement and editing during this revision. Clare O’Connor is my beacon and buttress, giving me guidance, love, and support throughout my life. Jim Casey, for your sage advice. Mary Allen Macneil, for your love and pride.

H. Morrow Long and everyone else at Yale University, who fostered my early interests in incident response and who continue to support my endeavors.

Robert Dunne, for his contribution to the previous edition; I mourn his passing.

Andy Johnson, for your continued camaraderie and sharing of ideas. Mike Lavine and Gerry Masson at Johns Hopkins University, for your support. All my colleagues at Stroz Friedberg, particularly Ken Mendelson for actually reading the previous edition and pointing out typographical errors.

Christopher Brown, Brian Carrier, Michael Cohen, Stefan Fleischmann, Jesse Kornblum, Dario Forte, Brian Karney, Matt Shannon, and other tool developers for your continued efforts to improve digital forensic tools.

Liz Brown, Kristi Anderson, and the entire team at Elsevier for your support and patience during the incubation of this project.
Susan W. Brenner

She is NCR Distinguished Professor of Law and Technology at the University of Dayton School of Law in Dayton, Ohio.

Professor Brenner has spoken at numerous events, including two Interpol Cybercrime Conferences, the Middle East IT Security Conference, the American Bar Association’s National Cybercrime Conference, and the Yale Law School Conference on Cybercrime. She spoke on cyberthreats and the nation-state at the Department of Homeland Security’s Global Cyber Security Conference and participated in a panel discussion of national security threats in cyberspace sponsored by the American Bar Association’s Standing Committee on Law and National Security. In 2009, she spoke at a meeting on cyberthreats organized by the U.S. Department of State Bureau of Intelligence and Research and National Intelligence Council. She has also spoken at a NATO Workshop on Cyberterrorism in Bulgaria and on terrorists’ use of the Internet at the American Society of International Law conference. She was a member of the European Union’s CTOSE project on digital evidence and served on two Department of Justice digital evidence initiatives. Professor Brenner chaired a Working Group in an American Bar Association project that developed the ITU Toolkit for Cybercrime Legislation for the United Nation’s International Telecommunications Union. She is a Senior Principal for Global CyberRisk, LLC.

Threats: Emerging Fault Lines of the Nation-States were published by Oxford University Press in 2007 and 2009, respectively. In 2010, Praeger published her most recent book, Cybercrime: Criminal Threats from Cyberspace.

Eoghan Casey
He is founding partner of cmdLabs, author of the foundational book Digital Evidence and Computer Crime, and coauthor of Malware Forensics. For over a decade, he has dedicated himself to advancing the practice of incident handling and digital forensics. He specializes in helping organizations handle security breaches, including network intrusions with international scope. He has been involved in a wide range of digital investigations, including network intrusions, fraud, violent crimes, identity theft, and online criminal activity. He has testified in civil and criminal cases, has been involved in international tribunals, and has submitted expert reports and prepared trial exhibits for digital forensic and cybercrime cases.

Previously, as a Director at Stroz Friedberg, he maintained an active docket of cases, supervised a talented team of forensic examiners, comanaged the company’s technical operations, and spearheaded external and in-house forensic training programs. Eoghan has performed thousands of forensic acquisitions and examinations, including cellular telephones and other mobile devices. He has performed vulnerability assessments; deployed and maintained intrusion detection systems, firewalls, and public key infrastructures; and developed policies, procedures, and educational programs for a variety of organizations. In addition, he conducts research and teaches graduate students at Johns Hopkins University Information Security Institute, is editor of the Handbook of Digital Forensics and Investigation, and is Editor-in-Chief of Elsevier’s International Journal of Digital Investigation.

Eoghan holds a B.S. in Mechanical Engineering from the University of California at Berkeley and an M.A. in Educational Communication and Technology from New York University.

Christopher Daywalt
He is a founding partner of cmdLabs, specializing in digital forensics, incident response, and related training. Chris has held positions ranging from system administrator to global security architect. Most recently he served as an instructor and course developer at the Defense Cyber Investigations Training Academy (DCITA), teaching Federal law enforcement and counter intelligence agents methodologies for investigating computer network intrusions.

Chris has also served as both a security analyst and an incident manager, handling enterprise-scale security incidents that involved large numbers of
compromised hosts and massive data theft. He has performed a wide array of tasks in this area including forensic analysis of compromised systems, network monitoring, and assessment of malware and incident containment. He also holds a Master of Science in Network Security.

**Monique M. Ferraro**

She is the principal at Technology Forensics, LLC, an electronic evidence consulting firm in Waterbury, Connecticut. She is a Certified Information Systems Security Professional as well as a Digital Certified Forensic Practitioner. A licensed attorney, she is also a professor. She teaches in the Forensic Computing Master’s Degree Program at John Jay College and at American Intercontinental University.

She is a graduate of Western Connecticut State University with a Bachelor’s Degree in Criminal Justice Administration (1985); she received her Master’s Degree from Northeastern University in Criminal Justice (1987) and her Juris Doctorate from the University of Connecticut School of Law (1998).

She worked for 18 years in several different capacities with the State of Connecticut Department of Public Safety: 8 years with the Crimes Analysis Unit of the State Police, 5 years with the Intelligence Unit of the State Police, and 5 years with the Computer Crimes and Electronic Evidence Laboratory within the Division of Scientific Services.

Attorney Ferraro has written a number of scholarly articles, book chapters, and one book (*Investigating Child Exploitation and Pornography: The Internet, the Law and Forensic Science*). She is an active member of the Connecticut Bar Association and has served as Chair of the Technology Section and has served on the Children and the Law Committee as well as the Women and the Law Committee.

In addition to her academic endeavors and professional service, Attorney Ferraro volunteers for Lawyers for Children America and has served on the State’s Commission on Child Protection as an appointee of the Governor. She is a member of the board of directors of Jane Doe No More, a nonprofit organization whose mission is to educate police officers and the public about proper methods of investigating sexual assault and dealing with its victims.

**Bert-Jaap Koops**

He is professor of regulation and technology at the Tilburg Institute for Law, Technology, and Society (TILT), the Netherlands. His main research interests are law and technology, in particular, criminal law issues such as cybercrime, investigation powers and privacy, and DNA forensics. He is also interested in other topics of technology regulation, such as data protection, identity, digital

Terrance Maguire

He is a partner at cmdLabs, conducting cybercrime investigations, including those involving network intrusions, insider attacks, anonymous and harassing e-mails, data destruction, electronic discovery, and mobile devices. He has nearly 20 years of experience in physical and digital forensic investigations, has developed and led training programs in varied areas of law enforcement and digital evidence, and has experience implementing counterintelligence intrusion detection programs.

Before working at cmdLabs, Terry was assistant director of Digital Forensics at Stroz Friedberg, where he was responsible for casework, lab management, and internal training efforts. His prior experience includes senior-level forensic computer analyst the U.S. State Department, where he was responsible for conducting analysis on digital evidence. As a cyber operations specialist for the Department of Defense, he implemented network surveillance, network packet analysis, wireless surveys, and intrusion detection. In addition, at the Defense Computer Investigations Training Program (DCITP), Terry developed and presented a broad range of instruction to federal law enforcement on topics such as computer search and seizure, incident response, digital evidence, computer forensic examinations, and intrusion investigations.

Earlier in his investigative career, as a forensic detective with the Chesterfield County Police Department in Virginia, Terry collected, evaluated, and processed evidence from crime scenes, prepared comprehensive case reports, and trained department personnel in forensic techniques. Subsequently, as a forensic scientist for the Virginia Division of Forensic Science, he conducted bloodstain pattern analysis in criminal cases and testified in court as an expert witness, and he was the principal instructor at the Forensic Science Academy.

Terry is a professorial lecturer at the George Washington University, where he teaches graduate-level courses focusing on incident response and computer intrusion investigations involving network-based attacks. He received an M.S. in Communication Technology from Strayer University and a B.S. in Chemistry from James Madison University. He is qualified as an ASCLD/LAB inspector in digital evidence and is a member of the Virginia Forensic Science Academy Alumni Association.
Michael McGrath
He divides his time between clinical, administrative, teaching, and research activities. His areas of special expertise include forensic psychiatry and criminal profiling. He has lectured on three continents and is a founding member of the Academy of Behavioral Profiling. He has published articles and/or chapters related to criminal profiling, sexual predators and the Internet, false allegations of sexual assault, and sexual asphyxia.

Tessa Robinson
She studied at Trinity College, Dublin, and at the Honorable Society of the King’s Inns. She was called to the Irish Bar in 1998.

Bradley Schatz
He is the director of the digital forensics consultancy Schatz Forensic and an adjunct associate professor at the Queensland University of Technology, Australia. Dr. Schatz divides his time between providing forensic services primarily to the legal sector and researching and educating in the area of computer forensics and digital evidence. Dr Schatz is the only Australian private practice practitioner to hold a PhD in computer forensics.

Benjamin Turnbull
He is a Post-Doctorate Researcher for the University of South Australia Defence and Systems Institute. His research interests include the misuse and evidentiary value of wireless networks, and understanding how the Internet facilitates global drug crime.

Brent E. Turvey
He spent his first years in college on a pre-med track only to change his course of study once his true interests took hold. He received a Bachelor of Science degree from Portland State University in Psychology, with an emphasis on Forensic Psychology, and an additional Bachelor of Science degree in History. He went on to receive his Master’s of Science in Forensic Science after studying at the University of New Haven, in West Haven, Connecticut.

Since graduating in 1996, Mr. Turvey has consulted with many organizations, attorneys, and law enforcement agencies in the United States, Australia, Scotland, China, Canada, Barbados, Singapore, and Korea on a range of rapes, homicides, and serial/multiple rape/death cases, as a forensic scientist and criminal profiler. In August of 2002, he was invited by the Chinese People’s Police Security University (CPPSU) in Beijing to lecture before groups of detectives at the Beijing, Wuhan, Hanzou, and Shanghai police bureaus.
In 2005, he was invited back to China again, to lecture at the CPPSU, and to the police in Beijing and Xian—after the translation of the second edition of his text into Chinese for the university. In 2007, he was invited to lecture at the First Behavioral Sciences Conference at the Home Team (Police) Academy in Singapore, where he also provided training to their Behavioral Science Unit. In 2010, he examined a series of sexual homicides for the Solicitor-General of the Crown Office and Procurator Fiscal Service (COPFS) in Edinburgh, Scotland.

He has also been court qualified as an expert in the areas of criminal profiling, crime scene investigation, crime scene analysis, forensic science, victimology, and crime reconstruction in many courts and jurisdictions around the United States.

He can be contacted via email at bturvey@forensic-science.com.
Introduction

In 2004, when I wrote the previous edition of this book, I described technology as a window into our lives and the lives of criminals. In this metaphor was a separation between the virtual and physical world. Now this separation is gone. Technology is integrated inseparably into our lives, present and active wherever we are.

In a sense, cyberspace turns itself inside out when the technology is aware of our physical location in the world, providing location-dependent services to the user and conversely enabling digital investigators to determine where an individual of interest was during the time of a crime. In Spook Country, William Gibson describes various facets of this eversion of cyberspace.

The locative properties of modern technology provide a prime example of this eversion. For instance, while I am having an Aussie at Brewer's Art in Baltimore, my smart phone is chattering with various systems to orient itself and provide me with information about my immediate surroundings. Opening the map function not only shows my location but also points out places of interest in the area such as Baltimore Symphony Orchestra (Meyerhoff Symphony Hall), Lyric Opera House, and Penn Station (Figure 1).

When I settle the tab, my credit card payment generates a record of the time and place. Walking out of the microbrewery down historic Charles Street exposes me to various CCTV cameras in the neighborhood, recording my physical presence in digital video format.

GPS technology like the device shown in Figure 2 is widely used to determine the most direct route to a destination. Forensic examination of such devices can reveal the location of an individual when a crime was committed.

The commercialization of GPS technology not only helps us navigate but also enables us to track others as demonstrated in the George Ford case described in Chapter 10. Individuals can share their location with friends via online services such as Google Latitude, and parents can use this technology to keep track of their family. For example, Verizon’s Family Locator service tied to their mobile
telephones can be configured with zones, causing the GPS coordinates of a mobile device to send a message to parents when their child enters and leaves home or school.

Our location can also be used to generate crowdsource services. For instance, Google aggregates location data from many people’s GPS-enabled mobile devices to generate information such as traffic patterns.
REACH OUT AND HURT SOMEONE

With this integration or eversion of cyberspace comes an increase in the reality of virtual events. Bullying in high schools and hate crimes in universities have moved into cyberspace, amplifying these harmful behaviors by delivering virtual blows anytime, anywhere. In January 2010, 15-year-old Pheobe Prince committed suicide as a result of cyberbullying (see Chapter 1). In September 2010, Rutgers student Tyler Clementi committed suicide after his roommate secretly set up a Webcam in their dorm room to stream video of Clementi making out with another man.

As covered in Chapter 12, pedophiles use the Internet to groom victims and arrange meetings to sexually exploit children.

Cyberstalkers use technology in creative ways to harass victims, not only causing psychological harm but also putting victims at risk of physical harm. In several cases, cyberstalkers have posted online ads encouraging others on the Internet to contact a victim for sex. In the case of Dellapenta (see Chapter 14), men showed up at the victim’s home.

Organized criminal groups are gaining unauthorized access to individuals’ bank accounts, viewing their computers and stealing their savings. In September 2010, members of a criminal group were arrested for their use of a malicious computer program named ZeuS to steal money from the bank accounts of thousands of victims.

Identity thieves are stealing personal information that is stored on computers and are using this information to obtain credit cards and other loans, buy houses and other valuable property, and even file for bankruptcy in the victim’s name. Identity fraud burdens victims with debts that can take years and substantial resources to clear from their name.

Nations are developing cyberweapons to cause physical damage through computers. The StuxNet malware that emerged in 2010 is a powerful demonstration of the potential for such attacks. It was a sophisticated program that enabled the attackers to alter the operation of industrial systems such as those in a nuclear reactor by accessing programmable logic controllers connected to the target computers. This type of attack could shut down a power plant or other components of a society’s critical infrastructure, potentially causing significant harm to people in a targeted region.

DIGITAL AND MULTIMEDIA SCIENCE

As the seriousness and scope of crimes involving computers increases, greater attention is being focused on apprehending and prosecuting offenders. New technologies and legislation are being developed to facilitate the investigation
of criminal activities involving computers. More organizations are seeking qualified practitioners to conduct digital investigations. In addition, increased awareness of digital forensics has drawn many people to the field.

One thing about digital forensics that appeals to many practitioners is the social contribution of serving the criminal justice system or another system such as national defense. Another thing about digital forensics that is appealing to many is that every case is different. Investigating human misuse of computers creates new puzzles and technical challenges, particularly when offenders attempt to conceal incriminating evidence and their activities on computer systems and networks. In addition, the growing demand for qualified practitioners also makes digital forensics an attractive career choice.

This growing interest and need has sparked heated debates about tools, terminology, definitions, standards, ethics, and many other fundamental aspects of this developing field. It should come as no surprise that this book reflects my positions in these debates. Most notably, this text reflects my firm belief that this field must become more scientific in its approach. The primary aim of this work is to help the reader tackle the challenging process of seeking scientific truth through objective and thorough analysis of digital evidence. A desired outcome of this work is to encourage the reader to advance this field as a forensic science discipline.

In an effort to provide clarity and direction, Chapter 6 specifically addresses the application of scientific method in all phases of a digital investigation. In addition, I encourage you to become involved in the DFRWS Conference (www.dfrws.org) and the Digital and Multimedia Section of the American Academy of Forensic Sciences (www.aafs.org). Finally, I encourage training programs and educational institutions to integrate forensic science into their digital forensics courses and not simply treat it as a technical subject.

By increasing the scientific rigor in digital forensics, we can increase the quality and consistency of our work, reducing the risk of miscarriages of justice based on improper digital evidence handling.

**TERMINOLOGY**

The movement toward standardization in how digital evidence and computer crime are handled has been made more difficult by the lack of agreement on basic terminology. There has been a great deal of debate among experts on just what constitutes a computer crime. Some people use the term *computer crime* to describe any crime that involves a computer. More specifically, computer crime refers to a limited set of offenses that are defined in laws such as the U.S. Computer Fraud and Abuse Act and the U.K. Computer Abuse Act. These crimes include theft of computer services; unauthorized access to protected computers;
software piracy and the alteration or theft of electronically stored information; extortion committed with the assistance of computers; obtaining unauthorized access to records from banks, credit card issuers, or customer reporting agencies; traffic in stolen passwords; and transmission of destructive viruses or commands.

One of the main difficulties in defining computer crime is that situations arise where a computer or network was not directly involved in a crime but still contains digital evidence related to the crime. As an extreme example, take a suspect who claims that she was using the Internet at the time of a crime. Although the computer played no role in the crime, it contains digital evidence relevant to the investigation. To accommodate this type of situation, the more general term computer-related is used to refer to any crime that involves computers and networks, including crimes that do not rely heavily on computers. Notably, some organizations, such as the U.S. Department of Justice and the Council of Europe, use the term cybercrime to refer to a wide range of crimes that involve computers and networks.

In an effort to be inclusive and most useful for practical application, the material in this book covers digital evidence as it applies to any crime and delves into specific computer crimes that are defined by laws in various countries. The term digital investigation is used throughout this text to encompass any and all investigations that involve digital evidence, including corporate, civil, criminal, and military.

The term computer forensics also means different things to different people. Computer forensics usually refers to the forensic examination of computer components and their contents such as hard drives, compact disks, and printers. However, the term is sometimes used more loosely to describe the forensic examination of all forms of digital evidence, including data traveling over networks (a.k.a. network forensics). To confuse matters, the term computer forensics has been adopted by the information security community to describe a wide range of activities that have more to do with protecting computer systems than gathering evidence.

As the field has developed into several distinct subdisciplines, including malware forensics and mobile device forensics, the more general term digital forensics has become widely used to describe the field as a whole.

**ROADMAP TO THE BOOK**

This book draws from four fields:

- Forensic Science
- Computer Science
- Law
- Behavioral Evidence Analysis
Law provides the framework within which all of the concepts of this book fit. Computer Science provides the technical details that are necessary to understand specific aspects of digital evidence. Forensic Science provides a general approach to analyzing any form of digital evidence. Behavioral Evidence Analysis provides a systematized method of synthesizing the specific technical knowledge and general scientific methods to gain a better understanding of criminal behavior and motivation.

This book is divided into five parts, beginning with the fundamental concepts and legal issues relating to digital evidence and computer crime in Part 1 (Digital Forensics: Chapters 1–5). Chapter 2 (Language of Computer Crime Investigation) explains how terminology of computer crime developed and provides the language needed to understand the different aspects of computer crime investigation. Chapter 3 (Digital Evidence in the Courtroom) provides an overview of issues that arise in court relating to digital evidence. Chapters 4 and 5 (Cybercrime Law: A United States Perspective and Cybercrime Law: A European Perspective) discuss legal issues that arise in computer-related investigations, presenting U.S. and European law side-by-side.

Part 2 (Digital Investigations: Chapters 6–9) discusses a systematic approach to investigating a crime based on the scientific method, providing a context for the remainder of this book. Chapter 7 (Handling a Digital Crime Scene) provides guidance on how to approach and process computer systems and their contents as a crime scene. Chapter 8 (Investigative Reconstruction with Digital Evidence) describes how to use digital evidence to reconstruct events and learn more about the victim and offender in a crime. Chapter 9 (Modus Operandi, Motive, and Technology) is a discussion of the relationship between technology and the people who use it to commit crime. Understanding the human elements of a crime and the underlying motivations can help answer crucial questions in an investigation, helping assess risks (will criminal activity escalate?), develop and interview suspects (who to look for and what to say to them), and focus inquiries (where to look and what to look for).

Part 4 (Computers: Chapters 15–20) begins by introducing basic forensic science concepts in the context of a single computer. Learning how to deal with individual computers is crucial because even when networks are involved, it is usually necessary to collect digital evidence stored on computers. Case examples and guidelines are provided to help apply the knowledge in this text to investigations. The remainder of Part 4 deals with specific kinds of computers.
and ends with a discussion of overcoming password protection and encryption on these systems.

Part 5 (Network Forensics: Chapters 21–25) covers computer networks, focusing specifically on the Internet. A top-down approach is used to describe computer networks, starting with the types of data that can be found on networked systems and the Internet, and progressively delving into the details of network protocols and raw data transmitted on networks. The “top” of a computer network comprises the software that people use, like e-mail and the Web. This upper region hides the underlying complexity of computer networks, and it is therefore necessary to examine and understand the underlying complexity of computer networks to fully appreciate the information that we find at the top of the network. Understanding the “bottom” of networks—the physical media (e.g., copper and fiber-optic cables) that carry data between computers—is also necessary to collect and analyze raw network traffic.

The forensic science concepts described early on in relation to a single computer are carried through to each layer of the Internet. Seeing concepts from forensic science applied in a variety of contexts will help the reader generalize the systematic approach to processing and analyzing digital evidence. Once generalized, this systematic approach can be applied to situations not specifically discussed in this text.

**DISCLAIMER**

Tools are mentioned in this book to illustrate concepts and techniques, not to indicate that a particular tool is best suited to a particular purpose. Digital investigators must take responsibility to select and evaluate their tools.

Any legal issues covered in this text are provided to improve understanding only and are not intended as legal advice. Seek competent legal advice to address specifics of a case and to ensure that nuances of the law are considered.

CHAPTER 19  Digital Evidence on Macintosh Systems .......... 587
Eoghan Casey
19.1 File Systems ....................................................................587
19.2 Overview of Digital Evidence Processing Tools ..........590
CHAPTER 20  Digital Evidence on Mobile Devices

Eoghan Casey and Benjamin Turnbull

This chapter appears online at http://www.elsevierdirect.com/companion.jsp?ISBN=9780123742681

PART 5  Network Forensics

CHAPTER 21  Network Basics for Digital Investigators

Eoghan Casey and Benjamin Turnbull

21.1  A Brief History of Computer Networks
21.2  Technical Overview of Networks
21.3  Network Technologies
21.4  Connecting Networks Using Internet Protocols
21.5  Summary

CHAPTER 22  Applying Forensic Science to Networks

Eoghan Casey

22.1  Preparation and Authorization
22.2  Identification
22.3  Documentation, Collection, and Preservation
22.4  Filtering and Data Reduction
22.5  Class/Individual Characteristics and Evaluation of Source
22.6  Evidence Recovery
22.7  Investigative Reconstruction
22.8  Reporting Results
22.9  Summary

CHAPTER 23  Digital Evidence on the Internet

Eoghan Casey

23.1  Role of the Internet in Criminal Investigations
23.2  Internet Services: Legitimate versus Criminal Uses
23.3 Using the Internet as an Investigative Tool .............................................................. 685
23.4 Online Anonymity and Self-Protection ............................................................... 691
23.5 E-mail Forgery and Tracking ........................................................................ 699
23.6 Usenet Forgery and Tracking ......................................................................... 703
23.7 Searching and Tracking on IRC ................................................................... 706
23.8 Summary ........................................................................................................ 711

CHAPTER 24 Digital Evidence on Physical and Data-Link Layers ............................................................ 713
Eoghan Casey
24.1 Ethernet ......................................................................................................... 714
24.2 Linking the Data-Link and Network Layers: Encapsulation ................................................... 716
24.3 Ethernet versus ATM Networks ...................................................................... 721
24.4 Documentation, Collection, and Preservation ................................................. 722
24.5 Analysis Tools and Techniques ...................................................................... 727
24.6 Summary ........................................................................................................ 736

CHAPTER 25 Digital Evidence at the Network and Transport Layers ............................................................ 737
Eoghan Casey
25.1 TCP/IP ............................................................................................................. 738
25.2 Setting up a Network ..................................................................................... 750
25.3 TCP/IP-Related Digital Evidence ................................................................... 754
25.4 Summary ........................................................................................................ 769

CASE INDEX ............................................................................................................... 771

NAME INDEX ........................................................................................................... 773

SUBJECT INDEX ....................................................................................................... 775
