RF and Digital Signal Processing for Software-Defined Radio
RF and Digital Signal Processing for Software-Defined Radio

A Multi-Standard Multi-Mode Approach

Tony J. Rouphael
For my son, John Joseph Rouphael,
You are the wind beneath my wings.

Now I am the last to keep Vigil,
like a gleaner after the vintage;
Since by the Lord’s blessing I have made progress
till like a vintager I have filled my winepress,
I would inform you that not for myself only have I toiled
but for every seeker after wisdom.

The book of Sirach 33:16-18
Contents

Acknowledgments ............................................. xi

Chapter 1: Introduction ........................................ 1
1.1 The Need for Software-Defined Radio ....................... 1
1.2 The Software-Defined Radio Concept ....................... 2
1.3 Software Requirements and Reconfigurability ............... 4
1.4 Aim and Organization of the Book ....................... 4
   References ........................................... 6

Chapter 2: Common Analog Modulation and Pulse-Shaping Methods .......... 7
2.1 Amplitude Modulation ................................... 8
2.2 Frequency and Phase Modulation ....................... 13
2.3 Common Pulse-Shaping Functions .................... 18
   References ........................................... 24

Chapter 3: Common Digital Modulation Methods .................. 25
3.1 Channel Capacity Interpreted ........................... 26
3.2 PSK Modulation ................................... 30
3.3 FSK Modulation ................................... 43
3.4 Continuous Phase Modulation (CPM) ................. 56
3.5 Gaussian MSK (GMSK) ................................... 56
3.6 On-Off Keying (OOK) ................................... 59
3.7 Quadrature Amplitude Modulation (QAM) ............... 61
3.8 Orthogonal Frequency Division Multiplexing (OFDM) ........ 65
3.9 Spread Spectrum Modulation ........................... 71
3.10 Appendix ........................................... 76
   References ........................................... 83
# Contents

Chapter 4: High-Level Requirements and Link Budget Analysis ........................................ 87
4.1 High-Level Requirements ......................................................... 88
4.2 Link Budget Analysis .......................................................... 100
4.3 Cascaded Noise Figure Analysis ............................................. 117
   References ............................................................................ 122

Chapter 5: Memoryless Nonlinearity and Distortion ......................................................... 123
5.1 1-dB Compression Point Due to Memoryless Nonlinearities ................................. 124
5.2 Signal Desensitization and Blocking ........................................... 128
5.3 Intermodulation Distortion ....................................................... 129
5.4 Cascaded Input-Referred Intercept Points ...................................... 140
5.5 Cross Modulation Distortion .................................................... 142
5.6 Harmonics ............................................................................ 149
5.7 Phase Noise and Reciprocal Mixing ........................................... 152
5.8 Spurious Signals ................................................................. 154
5.9 Appendix .............................................................................. 155
   References ............................................................................ 160

Chapter 6: Transceiver System Analysis and Design Parameters ................................. 161
6.1 Receiver Selectivity ............................................................... 161
6.2 Receiver Dynamic Range ......................................................... 165
6.3 AM/AM and AM/PM .............................................................. 167
6.4 Frequency Bands, Accuracy and Tuning .................................... 172
6.5 Modulation Accuracy: EVM and Waveform Quality Factor ................. 175
6.6 Adjacent Channel Leakage Ratio (ACLR) ................................ 194
6.7 Transmitter Broadband Noise .................................................. 196
   References ............................................................................ 198

Chapter 7: Uniform Sampling of Signals and Automatic Gain Control ................. 199
7.1 Sampling of Lowpass Signals .................................................... 199
7.2 Sampling of Bandpass Signals .................................................. 207
7.3 The AGC Algorithm ............................................................... 216
7.4 Appendix .............................................................................. 233
   References ............................................................................ 234
## Contents

### Chapter 8: Nyquist-Rate Data Conversion

8.1 Nyquist Converters .................................................. 235
8.2 Overview of Nyquist Sampling Converter Architectures ................. 266
8.3 Appendix ............................................................... 275
    References ............................................................. 277

### Chapter 9: $\Delta \Sigma$ Modulators for Data Conversion

9.1 The Concept of $\Delta \Sigma$ Modulation ............................................ 279
9.2 Comparison between Continuous-Time and Discrete-Time $\Delta \Sigma$ Modulation .... 285
9.3 SQNR Performance of $\Delta \Sigma$ Modulators ...................................... 300
9.4 Bandpass $\Delta \Sigma$ Modulators ................................................ 308
9.5 Common Architectures of $\Delta \Sigma$ Modulators ................................. 313
9.6 Further Nonidealities in $\Delta \Sigma$ Modulators ................................. 316
    References ............................................................. 317

### Chapter 10: Multirate Digital Signal Processing

10.1 Basics of Sample Rate Conversion ............................................ 319
10.2 Filter Design and Implementation ............................................. 340
10.3 Arbitrary Sampling Rate Conversion ........................................... 364
    References ............................................................. 375

Acknowledgments

I am deeply indebted to many individuals without whom this book would not have been a reality. Special thanks go to Harry Helms, Rachel Roumeliotis, Heather Scherer, Rajashree Satheesh Kumar, and Anne McGee from the editorial staff at Elsevier for all their help and guidance all throughout the writing of this book. I also would like to express my most sincere gratitude to the various reviewers who were instrumental in preparing the final manuscript. I especially would like to thank David Southcombe, Farbod Kamgar, Scott Griffith, Sumit Verma, Ricke Clark, Hui Liu, Mariam Motamed, and Kevin Shelby. Finally I would like to thank my wife Tabitha for all her love, support, and constant encouragement. Without her this book would not have been completed. Toby you are my guardian angel!
